Dedication

We humbly dedicate this project to the enhancement of School Students in from grade 6 to grade 11 and Teachers.

We believe this project usable for students who are aim to develop their knowledge that is worthy of in the counting implementation of subject matters in school syllabus and teachers who are willing to share their knowledge among others.

We finally dedicate this project to; our families whose untiring support and assistance have made possible the fruition of our efforts and our friends for their cooperation while conducting the study.

Acknowledgements

We would like to express our first special thanks of gratitude to our supervisor

Mr: Chaman Wijesiriwardane, who gave us golden support to do this project.

Secondly we would like to thank our mentor Mr: S. Hettihewa, who gave this project us on “Nanasala – Kalawana”.

Next to him are our parents, whom we are greatly indebted for us brought up with love and encourage to this stage.

In addition to, our friends who helped us a lot in finalizing this project within the limited time frame.

We have no valuable words to express our thanks, but our heart is still full of the favors received from every person.

Abstract

“E-School System” is one step further from Smart School since it provides cloud based user-friendly, powerful features to boost the school operations, enhance student efficiency. Next step is to automate the examination process along with a problem-based learning system. It would provide a good exposure for students to the world of problem-based learning in an interactive way. Even though the requirement is in E-School System, we think that such a platform will be useful to any student. To fulfill that, we decided to provide a platform which is public but having access control for those who are willing to keep their materials visible only for their institute.

A registered user has a role of teacher or student and have different facilities. Another user is the admin who can maintain and handle the system. Students of grade 6 to grade 11 to will have access to get papers, quizzes and also get support from the community. Video lessons have become a buzz in these days and paid users will have access for them too.

Mobile application will be provided for both iOS and android to watch videos, attempt quizzes and other basic functions.

Chapter 1

Introduction

1.1 Introduction

This “E-School System” mainly focuses on student’s convenience and time. Even there are many tuition classes in the country, many of classes are not based on questions papers. Therefore we try to refer students to a problem-based education system through this project. In additionally, this system provides videos for subjects and grades separately and details about teachers. Therefore, parents can find teachers for their children.

Even though there are some educational systems in the country, the lack of connection between students and teachers leads to unsuccessful learning teaching system. Hence, a way to communicate with students, facility to teachers to post their availability to conduct classes are some mainly focused requirements. User friendly system may help students to achieve their goals.

Background and motivation

As a list, here is the major importance of creating this platform.

- ☐ Reduce the time wastage of students.
- ☐ Ability to post teacher’s posts to correct audience.
- ☐ Ability to find solutions for most of educational problems.
- ☐ Provide day counter for student’s exam.
- ☐ Easily accessible video lessons and papers for students
- ☐ A community to discuss and solve student’s questions

Current education process wastes time of both the student and the examiner. This system provides a good way to learn for students. It can use at anytime, anywhere as student’s convenient.

1.2 Problem in Brief

- Although many people in an innovative society prefer an online education system, it is difficult to find the right one for it.
- Current education process wastes time of students and is not effective or efficient for a complete learning cycle of a student.
- Although there are many forms of self-studying for students in higher education, it is difficult to find right ways for school children for learning.

1.3 Aim and Objectives

1.3.1. Aim

The aim of this project is providing an efficient and effective solution to be integrated with E-School System for better education and learning process.

1.3.2. Objectives

To achieve the above aim, the following objectives will be achieved.

- Analyzing all the requirements and Designing the Web portal and the Mobile applications.
- Developing basic functionalities: question uploading, answering, marking, discussion part and etc.
- Update number of remaining days for exams.
- Periodically updating papers by admin panel.

1.4 Proposed Solution

After considering all those issues regarding educational institutes and their clients; students, we propose a “Student Management System” which is capable to give solutions for the problems that occur to stakeholders of an educational institute.

- Advertisement box
- Profiles of teacher and student
- Count-down for examinations
- Ask question box(Comment Area)
- Question paper 6-11 students (Online MCQ, Model & Past papers)
- Video of the subject's lessons
- Developed mobile application for this E-School system

For all Students

- Attempt online quizzes
- View papers
- View video lesson by a payment
- Post questions and comments

For all Teachers

- upload the course materials
- View learning materials
- Answers the students questions
- Post their information to get private classes

For Admin

- Add new items (papers, videos)
- Add new admins
- Approve advertisements, video access
- Manage teacher's advertisements, commercial advertisements, comments and etc.

1.5 Summary

This chapter provides a brief description about our project. In the next chapter we will describe about the existing system like our system.

Chapter 2**Technology Adapted****2.1 Introduction**

This is about what are the technologies we used in our project and why those are appropriate to solve the problem. When choosing suitable technologies we consider about compatibility, flexibility and processing speed.

2.2 Angular

Angular is a JavaScript open source front-end framework that is mainly used to develop single page web applications. It is a continuously growing and expanding framework which provides better ways for developing web applications. It changes the static HTML to dynamic HTML. It is an open source project which can be freely used and changed by anyone. It extends HTML attributes with Directives, and data is banded with HTML.

2.3 Nodejs

Node.js is a server-side platform built on Google Chrome's JavaScript Engine. Node.js was developed by Ryan Dahl in 2009 and its latest version is v0.10.36. Node.js is an open source, cross-platform runtime environment for developing server-side and networking applications. Node.js applications are written in JavaScript, and can be run within the Node.js runtime on OS X, Microsoft Windows, and Linux.

2.4 Express

Express.js is a web application framework for Node.js. It provides various features that make web application development fast and easy which otherwise takes more time using only Node.js.

Express.js is based on the Node.js middleware module called connect which in turn uses http module. So, any middleware which is based on connect will also work with Express.js.

2.5 MongoDB

MongoDB is a NoSQL database which stores the data in form of key-value pairs. It is an **Open Source, Document Database** which provides high performance and scalability along with data modeling and data management of huge sets of data in an enterprise application.

MongoDB also provides the feature of Auto-Scaling. Since, MongoDB is a cross platform database and can be installed across different platforms like Windows, Linux etc.

2.6 Ionic

Ionic is an advanced HTML5 hybrid mobile application framework. A big advantage of using Ionic is that the code base remains the same for all mobile platforms and the UI/UX looks like a native mobile platform. Ionic is several technologies that are neatly bundled and managed together. Ionic as a stack of several frameworks

Approach

3.1 Introduction

We are developing the software system using the technologies mentioned above. The system contains several functional sections. Those are user login/authentication, post questions, comment area, view/download papers, view video lessons by a payment, admin panel, teacher's advertisement section, other paid advertisement section, MCQ questions/answers section and exam day reminder section. Each section and description for those are described in this chapter.

3.2 System Description

- **User Login/Authentication**

This section provides login and signing up facility for users. If the user is new (s)he needs to sign up by filling a form. A new user has the capability of viewing /downloading papers, access lesson videos by a payment, post questions in discussion panel and add teachers advertisements if the user is registered as a teacher.

If the user forgot the password (s)he can get their password to their email address. An user can view their own profile and can edit any of their information.

- **Post Questions/Comments**

Anyone can post questions in the discussion panel, edit their posts. Those posts can be viewed by both registered and unregistered users but only registered users can add comments and edit or delete their own comments on those posts in discussion panel. Those posts will be organized by date of publish.

- **View/Download Papers**

A registered user can view/download papers for each subject in each grade. If the user is a teacher, (s)he can upload or update papers. User can search for particular paper by the subject.

- View Video Lessons

In this section, video lessons and tutorials will be available for each subject. A registered user can access these lessons by a payment through online. If the user is a teacher, (s) he can upload video lessons to this section. User can search for particular video by the subject.

- Admin Panel

In the login section admins can log in by switching login to admin login. Once an admin is logged in, dashboard will be appeared. Admin panel has capabilities of registering new admins, approving advertisements, approving video access for users, remove/delete papers and videos, upload papers and videos and remove unwanted comments, teacher's advertisements, inbox messages.

- Teacher's Advertisement Section

If the registered user is a teacher, (s) he can post an advertisement about tuition classes. These advertisements will be categorized by area, type of class (common/individual), subject and grade. All registered and unregistered users can view these advertisements and they can search for a particular class by the area with the search tab provided.

- Paid advertisement Section

All registered and unregistered users can view commercial advertisements that are available in the home page. These advertisements will be changed and presented like a slide show in the home page. These will be automatically deleted at the date set by the admin.

- Exam day Reminder Section

A registered user can add their upcoming exam date to this section. Then the system will notify the remaining days and time to that particular user every time they register. And they can edit and update it

3.3 Summary

In this chapter we described about the solution we made with the reference to users, inputs, outputs, process.

Analysis and Design

4.1 Introduction

Once we started developing the solution we designed the UML diagrams for the system to understand the basic and non-basic needs, understand the most appropriate software process model, create the most effective plan and reduce the risks that occur when developing a web application.

4.2 Requirements

4.2.1 Functional requirements

- Students, Teachers and Admin should be able to login to the system.
- Admin should be able to register a new admin.
- Admin should be able to approve payments, advertisements, and videos.
- Students and Teachers can comment.
- Admin can check comments and remove not suitable comments.
- Students can download papers and videos.
- Admin can view user's profiles.

4.2.2 Non-functional requirements

- User friendly interface.
- Good security system.
- Less time to loading and performing tasks.

4.3 System Diagrams

Chapter 5

Implementation

As our implementation process first, we requested for a document containing all need from the client. However, then we arranged some physical and virtual meetings to discuss about the project further.

Then for the planning process we divided the project to several parts and distributed them among members. Then for better control of the project we decided to use git for version controlling. We started using Github as a platform and then created two repositories for backend and Web-frontend to continue the work.

A team member implemented the user login authentication for the web-app. This authentication contains gathering information from the users who wish to register to the system. Also email validation is available for the sign up form.

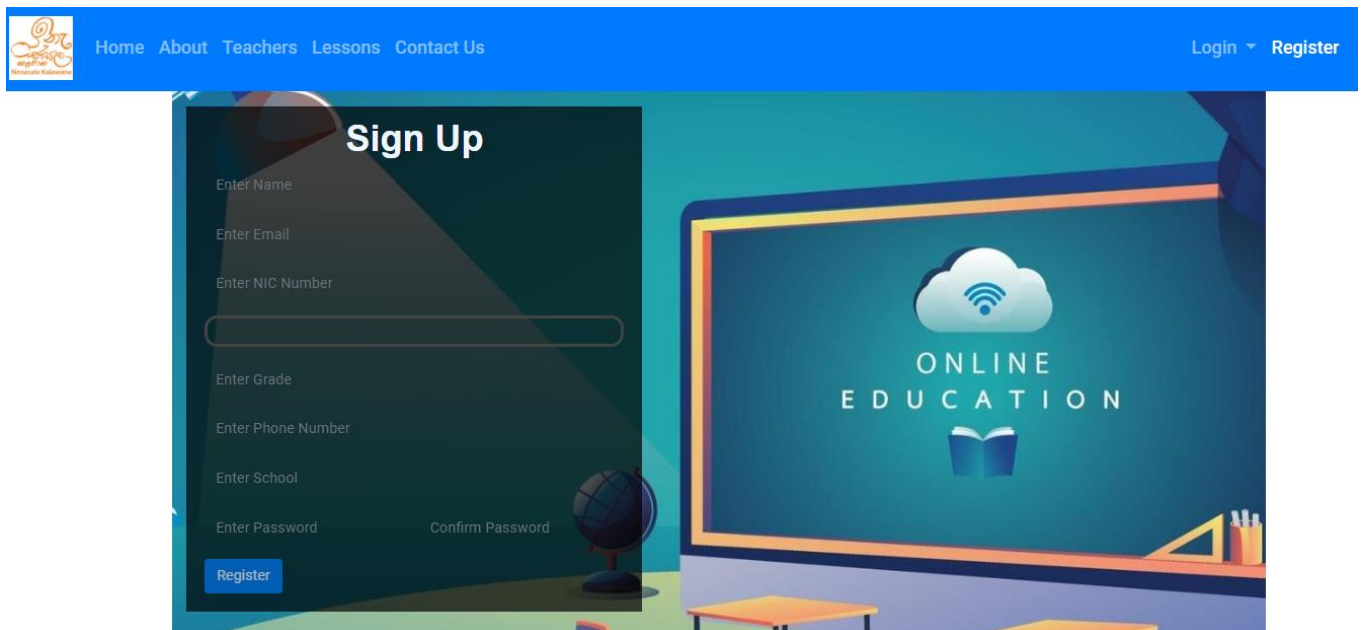

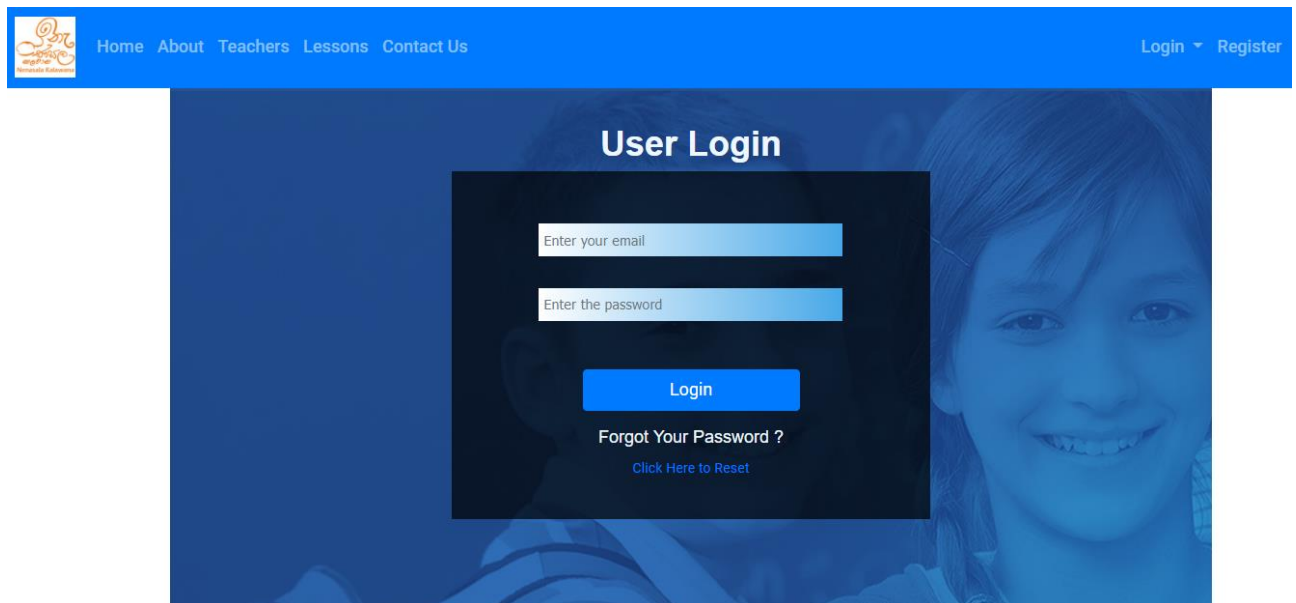

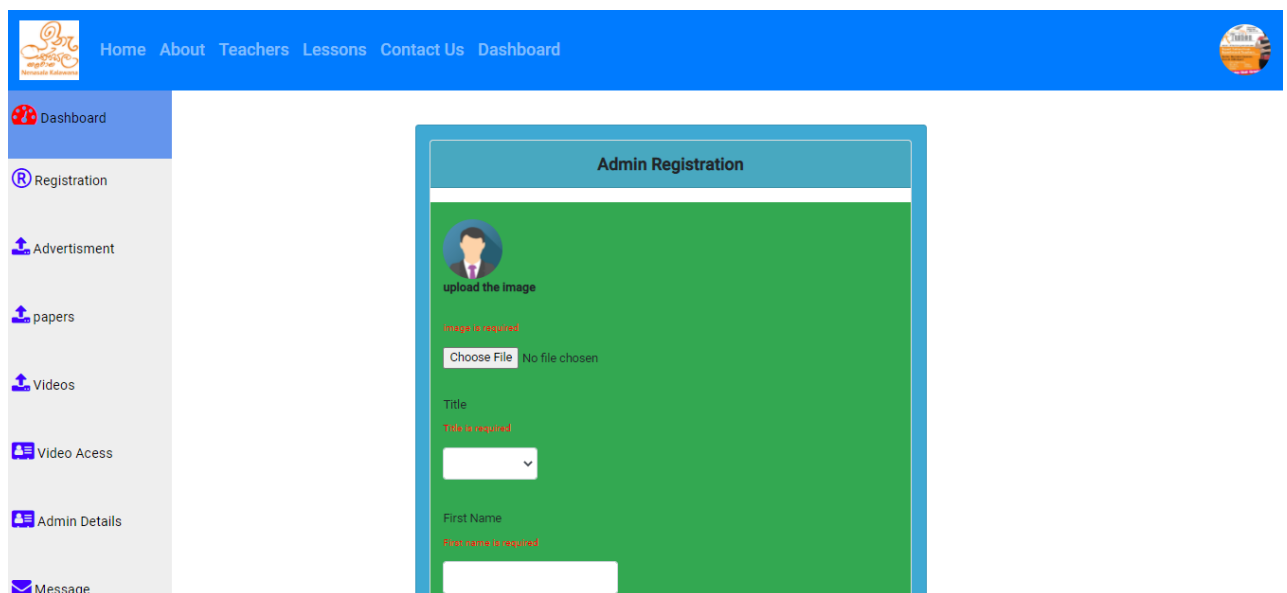

Figure 6.1

The image shows a web application interface with a blue header. The header contains a logo on the left, navigation links (Home, About, Teachers, Lessons, Contact Us) in the center, and 'Login' and 'Register' links on the right. The main content area has a blue background with a faint image of a smiling girl. Overlaid on this is a dark gray 'User Login' form. The form contains two input fields: 'Enter your email' and 'Enter the password'. Below these is a blue 'Login' button. Under the button, there is a link 'Forgot Your Password ?' and a smaller link 'Click Here to Reset'.

Figure 6.2

Another main milestone of our project is to implementing admin panel and admin authentication.

The image shows a web application interface with a blue header. The header contains a logo on the left, navigation links (Home, About, Teachers, Lessons, Contact Us, Dashboard) in the center, and a circular profile picture on the right. A left sidebar menu is visible with links: Dashboard, Registration, Advertisement, papers, Videos, Video Access, Admin Details, and Message. The main content area has a green background. Overlaid on this is a light blue 'Admin Registration' form. The form contains an 'upload the image' section with a red error message 'Image is required' and a 'Choose File' button. Below this is a 'Title' section with a red error message 'Title is required' and a dropdown menu. At the bottom is a 'First Name' section with a red error message 'First name is required' and an input field.

Figure 6.3

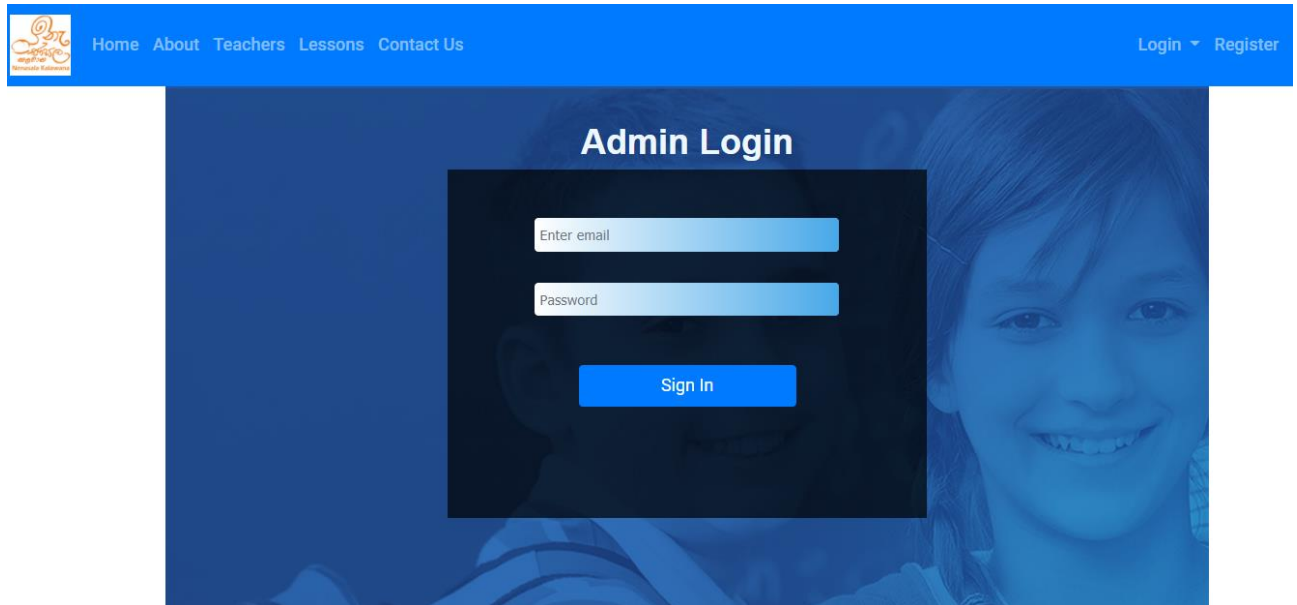

Figure 6.4

Another main part of the system is teacher's advertisement section. Providing facility of access teachers advertisement front, search bar to search teachers with the area is implemented.

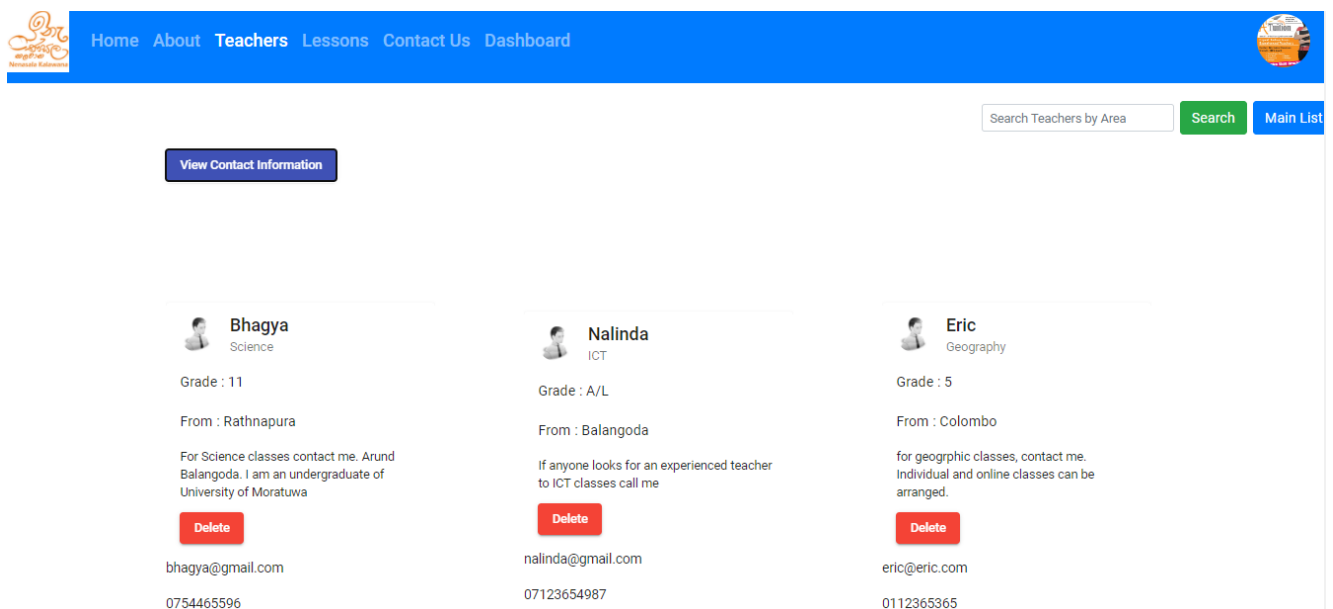

Figure 6.5

Also we implemented the front end to add teachers to this list.

The screenshot shows a web application interface for adding a new teacher. At the top, there is a blue navigation bar with links: Home, About, Teachers, Lessons, Contact Us, and Upload. A search bar labeled 'Search Teachers by Area' with a 'Search' button and a 'Main List' button are also present. Below the navigation bar, there are two buttons: 'View Contact Information' and 'Add Teacher'. The 'New Teacher' form contains the following fields:

- Name: Enter Name
- Subject: Enter Subject
- Area: Enter Area
- Grade: Enter Grade
- Email: Enter Email
- Telephone: (field is partially visible)

Figure 6.6

Next we have implemented a sample page for categorize by grades.

Evaluation & Conclusion

6.1 Introduction

This chapter discusses how efficient the implemented solution is in achieving the predefined objectives. It is elaborated through experiments as testing and results.

6.2 Testing and Results

User centric and system centric evaluation methods were used for evaluating each component. Under user centric level the utility and the value of the system to the user were evaluated. Different test procedures were followed to mock the user interaction and the respective outputs were analyzed.

Test Case	Module	Test Data	Expected Result	Test Result
T101	Login	Correct Username	Direct to the Home page.	Pass
		Correct Password		
T102	Login	Correct Username	Display Error Message.	Pass
		Incorrect Password		
T103	Login	Incorrect Username	Display Error Message.	Pass
		Correct Password		
T104	Login	Forgot Password	Redirects to Reset Password web page.	Pass
T105	Login	Incorrect Password	Display Error Message.	Pass
		Incorrect Username		
T107	Login	Empty Username and Password	Display Error Message	Pass
T108	Reset Password	Incorrect Email	Display Error Message	Pass
T109	Reset Password	Correct Email	Send password as an email to user	Pass

Appendix A

Individual Contribution

184083K - Kumarasinghe A.D.N.D

I'm responsible for implementing the front end and backend of MCQ question/answer section which has capabilities of updating/uploading/deleting MCQ questions, provide live results of the MCQ quiz for anyone who participated and provide correct answer.

Admin authentication backend implementing is also my responsibility.

In the mobile application I'm responsible for providing a section for separate lessons for students categorized by grade and subject. Also quiz questions for each lesson in the mobile app. At the end of each lesson, a student can give answers for quiz questions and see marks.

I'm also responsible for keeping track of each student who is registered and provide them a level based on what they have done so far in the MCQ questions.

184198R – Maduranga D.V.S

I'm responsible for implementing the frontend and backend of login user authentication. In the process of registering user, I'm responsible for validating their NIC number and email address.

Also, the front end and the backend of teacher's advertisements section, search bar to find particular teacher with the area, adding a new teacher advertisement to list.
